

A. Colocalization posterior probabilities

table2_coloc_pp_2026-01-27_014727.tsv

B. Colocalization interpretation

Evidence summary for the IL6R locus

PP.H4 shared variant	0.0480
PP.H3 distinct variants	0.0621
Highest posterior	H1 (0.890)
Interpretation	No strong shared-variant support

C. Main conclusion from colocalization

The posterior probability for a shared causal variant (PP.H4) was 0.048. Under common colocalization interpretation thresholds, this does not provide strong evidence that circulating IL6R protein and CRC risk share a causal variant at the IL6R locus.
